

FADE IN:

EXT. Work Desk in my Room – Night

At the desk of his room, a student sits at the table, fidgeting with on phones

DISSOLVE TO:

INT. Bed Room – Basement– Night

Student sits at a table with multiple iPhones and hardware parts preparing to dismantle them.

He prepares the camera, puts all the hardware within frame, and starts the recording

Courage

Hey Everybody, this is my instructional video on the different parts of an iPhone, and how to take apart the iPhone screen in order to see the inner hardware attached to the iPhone screen and the other main hardware of the iPhone that isn't attached to the screen. Hopefully in this video, you will learn all about the basics of the hardware, how to dethatch them, and additionally some information that you would need to know, if you were going to attempt to change your phone screen

Courage

(sighs, takes a deep breath)

first, we'll start off with the different parts of the iPhone. We have the outer screen which we will refer to as the home screen and the home button. This is the home screen and this is the home button. The home screen is separate from the home button. You can easily pop off the home button from home screen because the two are two separate entities. Next we have the camera. This right here is just the cut outs for the camera but the camera is actually separate from the home screen as well. If you ever needed to order a home screen for your camera, you would need to swap the camera to the new screen or order a new one if it were broken. Internally we have the battery. It is not so easily detachable and requires additional work to remove. We also have some plates to the left meant to keep some of the internal parts in place. And Finally we have the charging port that is bolted down by two screws.

Courage

(Flips phone to obtain a better view of the parts of focus.)

So let's go ahead and actually open this bad boy. The first step you need to do is take care of the two screws at the bottom. You want to make sure that you are handling the screws very delicately as iPhone is very stingy and the parts are specifically designed to be compatible with your device. You can use the zip lock bag method to preserve each type of screw in its own zip lock bag

(MORE)

Courage

(Two screw drivers are introduced into the setting)

Here we have the star head screw driver which is the larger screw driver of the two. We will call it screw driver A. For screw driver B we have a smaller more thin star head. Screw driver B will be used for the two bottom screw of the iPhone to lift the screen. Screw Driver A will be used to separate the outer screen or home screen, from the inner screen or digitizer.

Courage

So the first step is to take your screw driver B and unscrew the first bottom screw located at the very bottom of the iPhone outside of the charging port. Unscrew this by rotating left. Take off the screw. Put it in the Ziplock bag. Remember lefty loosy, righty tightly. Next step. Do the other screw repeating the same step, and put it in the Ziplock bag.

Courage

(Introduction of a new suction cup item and wedge into the setting)

Now for the actual removal process of the screen. You can use this suction cup to put on the screen, and also a wedge to get in between the crack you create with the suction device, to pry open the screen. Pull the suction cup device, and as it ups the screen from the rest of the iPhone, you will take your wedge device and insert it into the opening. With each iPhone there is a sticky adhesive that around the rim of the screen to keep it in place but also to make the iPhone water proof.

Courage

EXT. Virtual Environment

Now if you ever needed a screen replacement, let's say your screen had red, blue, or while lines across it. You would simply search up the iPhone model number, and then then Screen replacement. Here you will see a number of different ones. You want to read carefully to ensure you select the right one. Remember cheaper is not always better. To quickly explain, if you do have white lines or any sort of digital damage that involves your touch screen not working or being discolored, you want to select one that includes the digitizer. Additionally you also want to look for one that includes the adhesive replacement so that you can restore the water proof capabilities.
